Acoustical Privacy Treatments:

1. Dense, anti-microbial insulation packed into base cavity.
2. Recessed rubber gasket at floor track. Gasket material is dense enough for floor anchoring, yet still conforms to uneven flooring materials.
3. Recessed rubber gasket at panel-to-panel joints.
4. Recessed rubber gasket at panel-to-post joints.
5. Ceiling track specially engineered with triple gasket, t-shaped design, and ceiling compression hold-downs. Walls do not need to extend above ceiling grid.
6. Wall channels for connecting modular walls to conventional construction are reinforced with internal steel inserts and multiple levels of rubber gasketing.
7. Acoustical bottom seal for sliding or hinged doors.
8. Optional sound masking system recommended. Optimal setting at 40db.
9. Dense, anti-microbial insulation factory-installed and integral to panel.
